

HIGHLIGHTS OF PRESCRIBING INFORMATION

These highlights do not include all the information needed to use UTIBRON NEOHALER safely and effectively. See full prescribing information for UTIBRON NEOHALER.

UTIBRON™ NEOHALER® (indacaterol and glycopyrrolate) inhalation powder, for oral inhalation use
Initial U.S. Approval: 2015

WARNING: ASTHMA-RELATED DEATH

See full prescribing information for complete boxed warning.

- Long-acting beta₂-adrenergic agonists (LABAs), such as indacaterol, one of the active ingredients in UTIBRON NEOHALER, increase the risk of asthma-related death. A placebo-controlled study with another LABA (salmeterol) showed an increase in asthma-related deaths in patients receiving salmeterol. This finding of an increased risk of asthma-related death with salmeterol is considered a class effect of all LABAs, including indacaterol. (5.1)
- The safety and efficacy of UTIBRON NEOHALER in patients with asthma have not been established. UTIBRON NEOHALER is not indicated for the treatment of asthma. (5.1)

INDICATIONS AND USAGE

UTIBRON NEOHALER is a combination of indacaterol, a long-acting beta₂-adrenergic agonist (LABA), and glycopyrrolate, an anticholinergic, indicated for the long term, maintenance treatment of airflow obstruction in patients with chronic obstructive pulmonary disease (COPD) (1)

Limitations of Use: Not indicated for the relief of acute bronchospasm or for the treatment of asthma. (1, 5.1, 5.2)

DOSAGE AND ADMINISTRATION

- For oral inhalation only. Do not swallow UTIBRON capsules. Only use UTIBRON capsules with the NEOHALER device. (2)
- Maintenance treatment of COPD: The inhalation of the powder contents of one UTIBRON capsule twice-daily (2)

DOSAGE FORMS AND STRENGTHS

- Inhalation powder: UTIBRON capsules contain 27.5 mcg of indacaterol and 15.6 mcg glycopyrrolate inhalation powder for use with the NEOHALER device (3)

CONTRAINDICATIONS

- All LABAs are contraindicated in patients with asthma without use of a long-term asthma controller medication. (4) UTIBRON NEOHALER is not indicated for the treatment of asthma. (1)
- History of known hypersensitivity to indacaterol, glycopyrrolate, or to any of the ingredients. (4, 5.5)

WARNINGS AND PRECAUTIONS

- Do not initiate in acutely deteriorating COPD or to treat acute symptoms. (5.2)
- Do not use in combination with an additional medicine containing LABA because of risk of overdose. (5.3, 7.1)
- If paradoxical bronchospasm occurs, discontinue UTIBRON NEOHALER immediately and institute alternative therapy. (5.4)
- Use with caution in patients with cardiovascular or convulsive disorders, thyrotoxicosis, sensitivity to sympathomimetic drugs, diabetes mellitus, and ketoacidosis. (5.6, 5.7, 7.1)
- Worsening of narrow-angle glaucoma or urinary retention may occur. Use with caution in patients with narrow-angle glaucoma, prostatic hyperplasia, or bladder-neck obstruction and instruct patients to contact a physician immediately if symptoms occur. (5.8, 5.9)
- Be alert to hypokalemia and hyperglycemia. (5.11)

ADVERSE REACTIONS

Most common adverse reactions (incidence ≥2% and higher than placebo) are nasopharyngitis and hypertension. (6.1)

To report SUSPECTED ADVERSE REACTIONS, contact Novartis Pharmaceuticals Corporation at 1-888-669-6682 or FDA at 1-800-FDA-1088 or www.fda.gov/medwatch.

DRUG INTERACTIONS

- Other adrenergic drugs may potentiate effect: Use with caution (5.3, 7.1)
- Xanthine derivatives, steroids, diuretics or non-potassium sparing diuretics may potentiate hypokalemia or ECG changes. Use with caution. (7.2, 7.3)
- Monoamine Oxidase inhibitors, tricyclic antidepressants, and drugs that prolong QTc interval may potentiate effect on cardiovascular system. Use with extreme caution. (7.4)
- Beta-blockers may decrease effectiveness: Use with caution and only when medically necessary. (7.5)
- Anticholinergics: May interact additively with concomitantly used anticholinergic medications. Avoid administration of UTIBRON NEOHALER with other anticholinergic-containing drugs. (7.6)

USE IN SPECIFIC POPULATIONS

- Use in patients with severe renal impairment should be considered if the potential benefit of the treatment outweighs the risk. (8.6)

See 17 for PATIENT COUNSELING INFORMATION and Medication Guide.

Revised: 10/2015

17 PATIENT COUNSELING INFORMATION

* Sections or subsections omitted from the full prescribing information are not listed

FULL PRESCRIBING INFORMATION

WARNING: ASTHMA-RELATED DEATH

Long-acting beta₂-adrenergic agonists (LABAs) increase the risk of asthma-related death. Data from a large placebo-controlled U.S. study that compared the safety of another LABA (salmeterol) or placebo added to usual asthma therapy showed an increase in asthma-related deaths in patients receiving salmeterol. This finding with salmeterol is considered a class effect of all LABAs, including indacaterol, one of the active ingredients in UTIBRON NEOHALER.

The safety and efficacy of UTIBRON NEOHALER in patients with asthma have not been established. UTIBRON NEOHALER is not indicated for the treatment of asthma [see *Warnings and Precautions* (5.1)].

1 INDICATIONS AND USAGE

UTIBRON™ NEOHALER® is a combination of indacaterol and glycopyrrolate indicated for the long-term, maintenance treatment of airflow obstruction in patients with chronic obstructive pulmonary disease (COPD), including chronic bronchitis and/or emphysema.

Important Limitations of Use: UTIBRON NEOHALER is NOT indicated for the relief of acute bronchospasm or for the treatment of asthma [see *Warnings and Precautions* (5.1, 5.2)].

2 DOSAGE AND ADMINISTRATION

For oral inhalation only. Do not swallow UTIBRON capsules, as the intended effects on the lungs will not be obtained. UTIBRON capsules should only be used with the NEOHALER device [see *Overdosage* (10)].

The recommended dosage of UTIBRON NEOHALER is the inhalation of the contents of one UTIBRON capsule twice-daily using the NEOHALER device.

UTIBRON NEOHALER should be administered at the same time of the day, (1 capsule in the morning and 1 capsule in the evening), every day. More frequent administration or a greater number of inhalations (more than 1 capsule twice-daily) of UTIBRON NEOHALER is not recommended.

Store UTIBRON capsules in the blister, and only remove IMMEDIATELY BEFORE USE with the NEOHALER device.

No dosage adjustment is required for geriatric patients, patients with mild and moderate hepatic impairment, or patients with mild to moderate renal impairment.

3 DOSAGE FORMS AND STRENGTHS

Inhalation powder: UTIBRON NEOHALER consists of UTIBRON capsules containing indacaterol/glycopyrrolate powder for oral inhalation and the NEOHALER device. UTIBRON capsules contain 27.5 mcg/15.6 mcg of indacaterol/glycopyrrolate in a hypromellose capsule with yellow transparent cap and uncolored transparent body with black “” logo on the cap and black product code “IGP27.5_15.6” under the black bar on the body.

4 CONTRAINDICATIONS

All LABAs are contraindicated in patients with asthma without use of a long-term asthma control medication [see *Warnings and Precautions* (5.1)]. UTIBRON NEOHALER is not indicated for the treatment of asthma.

UTIBRON NEOHALER is contraindicated in patients who have demonstrated hypersensitivity to indacaterol, glycopyrrolate, or to any of the ingredients [see *Warnings and Precautions* (5.5)].

5 WARNINGS AND PRECAUTIONS

5.1 Asthma-Related Death [see *Boxed Warning*]

- Data from a large placebo-controlled U.S. study in asthma patients showed that LABAs may increase the risk of asthma-related death. Data are not available to determine whether the rate of death in patients with COPD is increased by LABAs.
- A 28-week, placebo-controlled U.S. study comparing the safety of another LABA (salmeterol) with placebo, each added to usual asthma therapy, showed an increase in asthma-related deaths in patients receiving salmeterol (13/13,176 in patients treated with salmeterol versus 3/13,179 in patients treated with placebo; RR 4.37, 95% CI 1.25, 15.34). The increased risk of asthma-related death is considered a class effect of the LABAs, including indacaterol, one of the ingredients in UTIBRON NEOHALER.

- No study adequate to determine whether the rate of asthma-related death is increased in patients treated with UTIBRON NEOHALER has been conducted. The safety and efficacy of UTIBRON NEOHALER in patients with asthma have not been established. UTIBRON NEOHALER is not indicated for the treatment of asthma.

5.2 Deterioration of Disease and Acute Episodes

UTIBRON NEOHALER should not be initiated in patients with acutely deteriorating or potentially life-threatening episodes of COPD. UTIBRON NEOHALER has not been studied in patients with acutely deteriorating COPD. The initiation of UTIBRON NEOHALER in this setting is not appropriate.

UTIBRON NEOHALER should not be used for the relief of acute symptoms, i.e., as rescue therapy for the treatment of acute episodes of bronchospasm. UTIBRON NEOHALER has not been studied in the relief of acute symptoms and extra doses should not be used for that purpose. Acute symptoms should be treated with an inhaled short-acting beta₂-agonist.

When beginning UTIBRON NEOHALER, patients who have been taking oral or inhaled, short-acting beta₂-agonists on a regular basis (e.g., 4 times a day) should be instructed to discontinue the regular use of these drugs and use them only for symptomatic relief of acute respiratory symptoms. When prescribing UTIBRON NEOHALER, the healthcare provider should also prescribe an inhaled, short-acting beta₂-agonist and instruct the patient on how it should be used. Increasing inhaled beta₂-agonist use is a signal of deteriorating disease for which prompt medical attention is indicated.

COPD may deteriorate acutely over a period of hours or chronically over several days or longer. If UTIBRON NEOHALER no longer controls the symptoms of bronchoconstriction; the patient's inhaled, short-acting beta₂-agonist becomes less effective; or the patient needs more inhalation of short-acting beta₂-agonist than usual, these may be markers of deterioration of disease. In this setting, a re-evaluation of the patient and the COPD treatment regimen should be undertaken at once. Increasing the daily dose of UTIBRON NEOHALER beyond the recommended dose is not appropriate in this situation.

5.3 Excessive Use of UTIBRON NEOHALER and Use with Other Long-Acting Beta₂-Adrenergic Agonists

As with other inhaled drugs containing beta₂-adrenergics, UTIBRON NEOHALER should not be used more often than recommended, at higher doses than recommended, or in conjunction with other medications containing LABAs, as an overdose may result. Clinically significant cardiovascular effects and fatalities have been reported in association with excessive use of inhaled sympathomimetic drugs. Patients using UTIBRON NEOHALER should not use another medicine containing a LABA for any reason [*see Drug Interactions (7.1)*].

5.4 Paradoxical Bronchospasm

As with other inhaled medicines, UTIBRON NEOHALER can produce paradoxical bronchospasm that may be life-threatening. If paradoxical bronchospasm occurs following dosing with UTIBRON NEOHALER, it should be treated immediately with an inhaled, short-acting bronchodilator; UTIBRON NEOHALER should be discontinued immediately and alternative therapy instituted.

5.5 Immediate Hypersensitivity Reactions

Immediate hypersensitivity reactions have been reported after administration of indacaterol or glycopyrrolate, the components of UTIBRON NEOHALER. If signs suggesting allergic reactions occur, in particular, angioedema (including difficulties in breathing or swallowing, swelling of tongue, lips and face), urticaria, or skin rash, UTIBRON NEOHALER should be discontinued immediately and alternative therapy instituted. UTIBRON NEOHALER should be used with caution in patients with severe hypersensitivity to milk proteins.

5.6 Cardiovascular Effects

Indacaterol, like other beta₂-agonists, can produce a clinically significant cardiovascular effect in some patients as measured by increases in pulse rate, systolic or diastolic blood pressure, or symptoms. If such effects occur, UTIBRON NEOHALER may need to be discontinued. In addition, beta-agonists have been reported to produce ECG changes, such as flattening of the T wave, prolongation of the QTc interval, and ST segment depression, although the clinical significance of these findings is unknown.

Therefore, UTIBRON NEOHALER should be used with caution in patients with cardiovascular disorders, especially coronary insufficiency, cardiac arrhythmias, and hypertension.

5.7 Coexisting Conditions

UTIBRON NEOHALER, like all medicines containing sympathomimetic amines, should be used with caution in patients with convulsive disorders or thyrotoxicosis, and in patients who are unusually responsive to sympathomimetic amines.

Doses of the related beta₂-agonist albuterol, when administered intravenously, have been reported to aggravate preexisting diabetes mellitus and ketoacidosis.

5.8 Worsening of Narrow-Angle Glaucoma

UTIBRON NEOHALER should be used with caution in patients with narrow-angle glaucoma. Prescribers and patients should be alert for signs and symptoms of acute narrow-angle glaucoma (e.g., eye pain or discomfort, blurred vision, visual halos or colored images in association with red eyes from conjunctival congestion and corneal edema). Instruct patients to consult a physician immediately should any of these signs or symptoms develop.

5.9 Worsening of Urinary Retention

UTIBRON NEOHALER should be used with caution in patients with urinary retention. Prescribers and patients should be alert for signs and symptoms of urinary retention (e.g., difficulty passing urine, painful urination), especially in patients with prostatic hyperplasia or bladder-neck obstruction. Instruct patients to consult a physician immediately should any of these signs or symptoms develop.

5.10 Hypokalemia and Hyperglycemia

Beta₂-adrenergic agonists may produce significant hypokalemia in some patients, which has the potential to produce adverse cardiovascular effects[see *Clinical Pharmacology* (12.2)]. The decrease in serum potassium is usually transient, not requiring supplementation. Inhalation of high doses of beta₂-adrenergic agonists may produce increases in plasma glucose.

In patients with severe COPD, hypokalemia may be potentiated by hypoxia and concomitant treatment [see *Drug Interactions* (7.2)], which may increase the susceptibility for cardiac arrhythmias.

In 2 clinical trials of 12-weeks duration evaluating UTIBRON NEOHALER in subjects with COPD, there was no evidence of a treatment effect on serum glucose or potassium.

6 ADVERSE REACTIONS

LABAs, such as indacaterol, one of the active ingredients in UTIBRON NEOHALER, increase the risk of asthma-related death. UTIBRON NEOHALER is not indicated for the treatment of asthma [see *Boxed Warning and Warnings and Precautions* (5.1)].

The following adverse reactions are described in greater detail in other sections:

- Paradoxical bronchospasm [see *Warnings and Precautions* (5.4)].
- Immediate hypersensitivity reactions [see *Warnings and Precautions* (5.5)].
- Cardiovascular effects [see *Warnings and Precautions* (5.6)].
- Worsening of narrow-angle glaucoma [see *Warnings and Precautions* (5.8)].
- Worsening of urinary retention [see *Warnings and Precautions* (5.9)].

6.1 Clinical Trials Experience

Because clinical trials are conducted under widely varying conditions, the adverse reaction rates observed in the clinical trials of a drug cannot be directly compared to rates in clinical trials of another drug and may not reflect the rates observed in clinical practice.

The UTIBRON NEOHALER safety database included 2654 subjects with COPD in two 12-week lung function trials and one 52-week long-term safety study. A total of 712 subjects received treatment with UTIBRON NEOHALER 27.5 mcg/15.6 mcg BID. The safety data described below are based on the two 12-week trials and the one 52-week trial.

12-Week Trials

The incidence of adverse reactions associated with UTIBRON NEOHALER in Table 1 is based on two 12-week, placebo-controlled trials (Trials 1 and 2; N=1,001 and N=1,042, respectively). Of the 2040 subjects, 63% were male and 91% were Caucasian. They had a mean age of 63 years and an average smoking history of 47 pack-years, with 52% identified as current smokers. At screening, the mean post-bronchodilator percent predicted forced expiratory volume in 1 second (FEV₁) was 55% (range: 29% to 79%), the mean post-bronchodilator FEV₁/forced vital capacity (FVC) ratio was 50% (range: 19% to 71%), and the mean percent reversibility was 23% (range: 0% to 144%).

The most common adverse reaction (incidence greater than or equal to 2% and higher than placebo) was nasopharyngitis and hypertension.

The proportion of patients who discontinued treatment due to adverse reactions was 2.95% for the UTIBRON NEOHALER treated patients and 4.13% for placebo-treated patients.

Subjects received 1 dose twice-daily of the following: UTIBRON NEOHALER 27.5 mcg/15.6 mcg, indacaterol 27.5 mcg, glycopyrrolate 15.6 mcg, or placebo.

Table 1. Adverse reactions with UTIBRON NEOHALER (greater than or equal to 1% incidence and higher than placebo) in COPD patients

Adverse Reaction	UTIBRON NEOHALER 27.5/15.6 mcg BID (N=508) n (%)	Indacaterol 27.5 mcg BID (N=511) n (%)	Glycopyrrolate 15.6 mcg BID (N=513) n (%)	Placebo (N=508) n (%)
Nasopharyngitis	21 (4.1)	13 (2.5)	12 (2.3)	9 (1.8)
Hypertension	10 (2.0)	5 (1.0)	3 (0.6)	7 (1.4)
Back pain	9 (1.8)	7 (1.4)	2 (0.4)	3 (0.6)
Oropharyngeal pain	8 (1.6)	4 (0.8)	8 (1.6)	6 (1.2)

Other adverse reactions occurring more frequently with UTIBRON NEOHALER than with placebo, but with an incidence of less than 1% include dyspepsia, gastroenteritis, chest pain, fatigue, peripheral edema, rash/pruritus, insomnia, dizziness, bladder obstruction/urinary retention, atrial fibrillation, palpitations, tachycardia.

52-Week Trial

In a long-term safety trial, 614 subjects were treated for up to 52 weeks with indacaterol/glycopyrrolate 27.5 mcg/15.6 mcg twice-daily, indacaterol/glycopyrrolate 27.5/31.2 mcg twice-daily or indacaterol 75 mcg once-daily. The demographic and baseline characteristics of the long-term safety trial were similar to those of the placebo-controlled efficacy trials described above. The adverse reactions reported in the long-term safety trial were consistent with those observed in the placebo-controlled trials of 12 weeks. Additional adverse reactions that occurred with a frequency greater than or equal to 2% in the group receiving indacaterol/glycopyrrolate 27.5 mcg/15.6 mcg twice-daily that exceeded the frequency of indacaterol 75 mcg once-daily in this trial were: upper and lower respiratory tract infection, pneumonia, diarrhea, headache, gastroesophageal reflux disease, hyperglycemia, rhinitis.

6.2 Postmarketing Experience

The following additional adverse reaction of angioedema has been identified during worldwide post-approval use of indacaterol/glycopyrrolate at higher than the recommended dose. Because this reaction is reported voluntarily from a population of uncertain size, it is not always possible to reliably estimate the frequency or establish a causal relationship to drug exposure.

7 DRUG INTERACTIONS

7.1 Adrenergic Drugs

If additional adrenergic drugs are to be administered by any route, they should be used with caution because the sympathetic effects of indacaterol, a component of UTIBRON NEOHALER, may be potentiated [see *Warnings and Precautions* (5.3, 5.6, 5.7, 5.11)].

7.2 Xanthine Derivatives, Steroids, or Diuretics

Concomitant treatment with xanthine derivatives, steroids, or diuretics may potentiate any hypokalemic effect of beta₂-adrenergic agonists such as indacaterol, a component of UTIBRON NEOHALER [see *Warnings and Precautions* (5.11)].

7.3 Non-Potassium-Sparing Diuretics

The electrocardiographic (ECG) changes and/or hypokalemia that may result from the administration of non-potassium-sparing diuretics (such as loop or thiazide diuretics) can be acutely worsened by beta-agonists, such as indacaterol, a component of UTIBRON NEOHALER, especially when the recommended dose of the beta-agonist is exceeded. Although the clinical relevance of these effects is not known, caution is advised in the coadministration of UTIBRON NEOHALER with non-potassium-sparing diuretics.

7.4 Monoamine Oxidase Inhibitors, Tricyclic Antidepressants, QTc Prolonging Drugs

Indacaterol, one of the components of UTIBRON NEOHALER, as with other beta₂-agonists, should be administered with extreme caution to patients being treated with monoamine oxidase inhibitors, tricyclic antidepressants, or other drugs known to prolong the QTc interval because the action of adrenergic agonists on the cardiovascular system may be potentiated by these agents. Drugs that are known to prolong the QTc interval may have an increased risk of ventricular arrhythmias.

7.5 Beta-Blockers

Beta-adrenergic receptor antagonists (beta-blockers) and UTIBRON NEOHALER may interfere with the effect of each other when administered concurrently. Beta-blockers not only block the therapeutic effects of beta-agonists, but may produce severe bronchospasm in COPD patients. Therefore, patients with COPD should not normally be treated with beta-blockers. However, under certain circumstances, e.g., as prophylaxis after myocardial infarction, there may be no acceptable alternatives to the use of beta-blockers in patients with COPD. In this setting, cardioselective beta-blockers could be considered, although they should be administered with caution.

7.6 Anticholinergics

There is potential for an additive interaction with concomitantly used anticholinergic medicines. Therefore, avoid coadministration of UTIBRON NEOHALER with other anticholinergic-containing drugs as this may lead to an increase in anticholinergic adverse effects [*see Warnings and Precautions (5.8, 5.9), Adverse Reactions (6)*].

7.7 Inhibitors of Cytochrome P450 3A4 and P-gp Efflux Transporter

Drug interaction studies with indacaterol, a component of UTIBRON NEOHALER, were carried out using potent and specific inhibitors of CYP3A4 and P-gp (i.e., ketoconazole, erythromycin, verapamil, and ritonavir). The data suggest that systemic clearance of indacaterol is influenced by modulation of both P-gp and CYP3A4 activities and that the 2-fold area under the curve (AUC) increase caused by the strong dual inhibitor ketoconazole reflects the impact of maximal combined inhibition. Indacaterol was evaluated in clinical trials for up to 1 year at doses up to 600 mcg. Inhibition of the key contributors of indacaterol clearance, CYP3A4 and P-gp, has no impact on safety of therapeutic doses of indacaterol. Therefore, no dose adjustment is warranted at the recommended 27.5/15.6 mcg twice-daily dose for UTIBRON NEOHALER when administered concomitantly with inhibitors of CYP3A4 and P-gp [*see Clinical Pharmacology (12.3)*].

8 USE IN SPECIFIC POPULATIONS

8.1 Pregnancy

Teratogenic Effects: Pregnancy Category C

There are no adequate and well-controlled studies with UTIBRON NEOHALER or its individual components, indacaterol and glycopyrrolate, in pregnant women. Animal reproduction studies were conducted with individual components, indacaterol and glycopyrrolate. Because animal reproduction studies are not always predictive of human response, UTIBRON NEOHALER should be used during pregnancy only if the potential benefit justifies the potential risk to the fetus. Women should be advised to contact their physician if they become pregnant while taking UTIBRON NEOHALER.

Indacaterol: Indacaterol was not teratogenic in Wistar rats and New Zealand rabbits at approximately 340 and 770 times, respectively, the MRHD in adults (on an AUC basis at maternal subcutaneous doses up to 1 mg/kg/day in rats and rabbits).

Glycopyrrolate: Glycopyrrolate was not teratogenic in Wistar rats or New Zealand White rabbits at approximately 1400 and 530 times, respectively, the MRHD in adults (on an AUC basis at maternal inhaled doses up to 3.83 mg/kg/day in rats and up to 4.4 mg/kg/day in rabbits).

Non-teratogenic Effects:

Indacaterol: There were no effects on peri-natal and post-natal developments in rats at approximately 110 times the MRHD in adults (on an AUC basis at maternal subcutaneous doses up to 0.3 mg/kg/day).

Glycopyrrolate: There were no effects on peri-natal and post-natal developments in rats at approximately 1100 times the MRHD in adults (on an AUC basis at maternal subcutaneous doses up to 1.88 mg/kg/day).

8.2 Labor and Delivery

There are no adequate and well-controlled human trials that have investigated the effects of UTIBRON NEOHALER during labor and delivery. Because beta-agonists may potentially interfere with uterine contractility, UTIBRON NEOHALER should be used during labor only if the potential benefit justifies the potential risk.

In human parturients undergoing caesarean section, 86 minutes after a single intramuscular injection of 0.006 mg/kg glycopyrrolate, umbilical plasma concentrations were low.

8.3 Nursing Mothers

UTIBRON NEOHALER: It is not known whether UTIBRON NEOHALER is excreted in human breast milk. Because many drugs are excreted in human milk, caution should be exercised when UTIBRON NEOHALER is administered to a nursing woman. Since there are no data from well-controlled human studies on the use of UTIBRON NEOHALER by nursing mothers, based on the data for the individual components, a decision should be made whether to discontinue nursing or to discontinue UTIBRON NEOHALER, taking into account the importance of UTIBRON NEOHALER to the mother.

Indacaterol: It is not known whether indacaterol is excreted in human breast milk. Indacaterol (including its metabolites) have been detected in the milk of lactating rats.

Glycopyrrolate: It is not known whether glycopyrrolate is excreted in human breast milk. Glycopyrrolate (including its metabolites) have been detected in the milk of lactating rats and reached up to 10-fold higher concentrations in the milk than in the blood of the dam.

8.4 Pediatric Use

UTIBRON NEOHALER is not indicated for use in children. The safety and efficacy of UTIBRON NEOHALER in pediatric patients have not been established.

8.5 Geriatric Use

Based on available data, no adjustment of UTIBRON NEOHALER dosage in geriatric patients is warranted. UTIBRON NEOHALER can be used at the recommended dose in elderly patients 75 years of age and older.

Of the total number of subjects in clinical studies of UTIBRON NEOHALER, 45% were aged 65 and older, while 11% were aged 75 and older. No overall differences in safety or effectiveness were observed between these subjects and younger subjects, and other reported clinical experience has not identified differences in responses between the elderly and younger patients, but greater sensitivity of some older individuals cannot be ruled out.

8.6 Renal Impairment

Based on the pharmacokinetic characteristics of its monotherapy components, UTIBRON NEOHALER can be used at the recommended dose in patients with mild to moderate renal impairment. In patients with severe renal impairment (estimated GFR less than 30 mL/min/1.73m²) or end-stage renal disease requiring dialysis, UTIBRON NEOHALER should be used if the expected benefit outweighs the potential risk since the systemic exposure to glycopyrrolate may be increased in this population [see *Clinical Pharmacology* (12.3)].

8.7 Hepatic Impairment

Based on the pharmacokinetic characteristics of its monotherapy components, UTIBRON NEOHALER can be used at the recommended dose in patients with mild to moderate hepatic impairment. Studies in subjects with severe hepatic impairment have not been performed [see *Clinical Pharmacology* (12.3)].

10 OVERDOSAGE

In COPD patients, doses of up to 600/124.8 mcg UTIBRON NEOHALER were inhaled over 2 weeks and there were no relevant effects on heart rate, QTc-interval, blood glucose or serum potassium. There was an increase in ventricular ectopies after 14 days of dosing with 300/124.8 and 600/124.8 mcg UTIBRON NEOHALER, but low prevalence and

small patient numbers (N=49 and N=51 for 600/124.8 mcg and 300/124.8 mcg UTIBRON NEOHALER, respectively) precluded accurate analysis. In a total of four patients non-sustained ventricular tachycardia was recorded with the longest episode recorded being 9 beats (4 seconds).

In healthy volunteers, single dose administration of UTIBRON NEOHALER at up to a dose of 440/499.2 mcg indacaterol/glycopyrrolate was well-tolerated without clinically significant effects on the ECG, serum potassium or blood glucose.

UTIBRON NEOHALER contains both indacaterol and glycopyrrolate; therefore, the risks associated with overdosage for the individual components described below apply to UTIBRON NEOHALER. Treatment of overdosage consists of discontinuation of UTIBRON NEOHALER together with institution of appropriate symptomatic and/or supportive therapy. The judicious use of a cardioselective beta-receptor blocker may be considered, bearing in mind that such medicine can produce bronchospasm. Cardiac monitoring is recommended in cases of overdosage.

Indacaterol

The potential signs and symptoms associated with overdosage of indacaterol are those of excessive beta-adrenergic stimulation and occurrence or exaggeration of any of the signs and symptoms, e.g., angina, hypertension or hypotension, tachycardia, with rates up to 200 bpm, arrhythmias, nervousness, headache, tremor, dry mouth, palpitation, muscle cramps, nausea, vomiting, drowsiness, dizziness, fatigue, malaise, hypokalemia, hyperglycemia, metabolic acidosis and insomnia. As with all inhaled sympathomimetic medications, cardiac arrest and even death may be associated with an overdose of indacaterol.

In COPD patients, single doses of indacaterol 3000 mcg were associated with moderate increases in pulse rate, systolic blood pressure and QTc interval.

Glycopyrrolate

An overdose of glycopyrrolate may lead to anticholinergic signs and symptoms such as nausea, vomiting, dizziness, lightheadedness, blurred vision, increased intraocular pressure (causing pain, vision disturbances or reddening of the eye), obstipation or difficulties in voiding.

In COPD patients, repeated orally inhaled administration of glycopyrrolate at total doses of 124.8 and 249.6 mcg once-daily for 28 days were well tolerated.

Peak plasma levels and total systemic exposure following intravenous administration of 150 mcg glycopyrrolate (equivalent to 120 mcg active moiety) in healthy volunteers were respectively about 270-fold and 13-fold higher than the peak and total systemic exposure at steady-state achieved with the recommended daily dose of 31.2 mcg of glycopyrrolate (i.e., 15.6 mcg glycopyrrolate twice-daily) and were well tolerated.

11 DESCRIPTION

UTIBRON NEOHALER consists of a dry powder formulation for delivery of a combination of indacaterol and glycopyrrolate to patients by oral inhalation only with the NEOHALER device. The inhalation powder is packaged in hypromellose (HPMC) capsules with yellow transparent cap and uncolored transparent body.

Each capsule contains a dry powder blend of 27.5 mcg/15.6 mcg of indacaterol/glycopyrrolate with approximately 24.9 mg of lactose monohydrate (which contains trace levels of milk protein) and 0.03 mg of magnesium stearate

One active component of UTIBRON NEOHALER is indacaterol maleate, a (R) enantiomer. Indacaterol maleate is a selective beta₂-adrenergic agonist. Its chemical name is (R)-5-[2-(5,6-Diethylindan-2-ylamino)-1-hydroxyethyl]-8-hydroxy-1H-quinolin-2-one maleate; its structural formula is

Indacaterol maleate has a molecular weight of 508.56, and its empirical formula is $C_{24}H_{28}N_2O_3 \cdot C_4H_4O_4$. Indacaterol maleate is a white to very slightly grayish or very slightly yellowish powder. Indacaterol maleate is slightly soluble in ethanol and very slightly soluble in water.

The other active component of UTIBRON NEOHALER is glycopyrrolate, which, is chemically described as (3RS)-3-[(2SR)-(2-cyclopentyl-2-hydroxy-2-phenylacetyl) oxy]-1,1-dimethylpyrrolidinium bromide. This synthetic quaternary ammonium compound acts as a competitive antagonist at muscarinic acetylcholine receptors, also referred to as anticholinergic. Glycopyrrolate, $C_{19}H_{28}BrNO_3$, is a white powder that is freely soluble in water and sparingly soluble in absolute ethanol. It has a molecular mass of 398.33. The structural formula is:

The NEOHALER device is a plastic inhalation device used to inhale the dry powder within the UTIBRON capsule. The amount of drug delivered to the lung will depend on patient factors, such as inspiratory flow rate and inspiratory time.

Under standardized in vitro testing at a fixed flow rate of 90 L/min for 1.3 seconds, the NEOHALER inhaler delivered 20.8 mcg of indacaterol and 12.8 mcg glycopyrrolate for the 27.5 mcg/15.6 mcg dose strength (equivalent to 27.5/12.5 mcg of indacaterol/glycopyrronium) from the mouthpiece. This in vitro testing revealed that the NEOHALER device had a specific resistance of 0.059 cm $H_2O^{1/2}$ /L/min. Peak inspiratory flow rates (PIFR) achievable through the NEOHALER device were evaluated in 26 adult patients with COPD of varying severity. Mean PIFR was 95 L/min (range 52 to 133 L/min) for adult patients. Twenty-five of 26 patients (96%) in this study generated a PIFR through the device exceeding 60 L/min.

12 CLINICAL PHARMACOLOGY

12.1 Mechanism of Action

UTIBRON NEOHALER contains both indacaterol and glycopyrrolate. The mechanisms of action described below for the individual components apply to UTIBRON NEOHALER. These drugs represent 2 different classes of medications (a LABA and an anticholinergic) that have different and additive effects on clinical and physiological indices.

Indacaterol: Indacaterol is a long-acting beta₂-adrenergic agonist (LABA). When inhaled, indacaterol acts locally in the lung as a bronchodilator. Although beta₂-receptors are the predominant adrenergic receptors in bronchial smooth muscle and beta₁-receptors are the predominant receptors in the heart, there are also beta₂-adrenergic receptors in the human heart comprising 10% to 50% of the total adrenergic receptors. The precise function of these receptors is not known, but their presence raises the possibility that even highly selective beta₂-adrenergic agonists may have cardiac effects.

The pharmacological effects of beta₂-adrenoceptor agonist drugs, including indacaterol, are at least in part attributable to stimulation of intracellular adenylyl cyclase, the enzyme that catalyzes the conversion of adenosine triphosphate (ATP) to cyclic-3', 5'-adenosine monophosphate (cyclic monophosphate). Increased cyclic AMP levels cause relaxation of bronchial smooth muscle and inhibition of release of mediators of immediate hypersensitivity from cells, especially from mast cells. In vitro studies have shown that indacaterol has more than 24-fold greater agonist activity at beta₂-receptors compared to beta₁-receptors and 20-fold greater agonist activity compared to beta₃-receptors. The clinical significance of these findings is unknown.

Glycopyrrolate: Glycopyrrolate is a long-acting muscarinic antagonist, which is often referred to as an anticholinergic. It has similar affinity to the subtypes of muscarinic receptors M1 to M5. In the airways, it exhibits pharmacological effects through inhibition of M3 receptor at the smooth muscle leading to bronchodilation. The competitive and reversible nature of antagonism was shown with human and animal origin receptors and isolated organ preparations. In preclinical in vitro as well as in vivo studies, prevention of methacholine-induced bronchoconstrictive effects was dose-dependent and lasted

longer than 24 hours. The clinical relevance of these findings is unknown. The bronchodilation following inhalation of glycopyrrolate is predominantly a site-specific effect.

12.2 Pharmacodynamics

Cardiac Electrophysiology

The QTc interval was studied in TQT studies with UTIBRON NEOHALER and with each of the monotherapy components. The TQT studies with indacaterol and glycopyrrolate demonstrated that neither of the compounds had a relevant effect on the corrected QT interval at supratherapeutic and therapeutic doses (for glycopyrrolate only a supratherapeutic dose was tested).

In a randomized, partially-blinded, placebo- and positive-controlled, crossover TQT study in 84 healthy subjects a supratherapeutic dose of UTIBRON NEOHALER (indacaterol/glycopyrrolate 440/499.2 mcg) was administered. This is a 16/32 dose multiple compared to a single dose of the recommended 27.5/15.6 mcg twice-daily dosage of UTIBRON NEOHALER which resulted in exposure multiples for mean C_{max} of 9.3 for indacaterol and 35.2 for glycopyrrolate compared to steady state pharmacokinetics of UTIBRON NEOHALER 27.5/15.6 mcg twice-daily. The mean maximal change from baseline in QTcI compared to placebo was 8.70 msec (2-sided 90% CI 7.3, 10.1) at 30 minutes after dosing. Although a marginal QT effect of UTIBRON NEOHALER was observed at the supratherapeutic dose, it is unlikely there will be a clinically relevant effect at the therapeutic exposure.

12.3 Pharmacokinetics

Absorption

Following inhalation of UTIBRON NEOHALER, the median time to reach peak plasma concentrations of indacaterol and glycopyrrolate was achieved rapidly at approximately 15 minutes and 5 minutes, respectively.

The steady-state systemic exposure ($AUC_{0-12h,ss}$; $C_{max,ss}$) to indacaterol and glycopyrrolate is similar after the twice-daily inhalation of 2 (times 2) capsules of UTIBRON NEOHALER 27.5 mcg/15.6 mcg as compared to the twice-daily inhalation of the monotherapy products indacaterol 27.5 mcg (times 2) alone or glycopyrrolate 15.6 mcg (times 2) alone respectively.

Indacaterol: Absolute bioavailability of indacaterol after an inhalation dose was on average 43-45%. Systemic exposure results from a composite of pulmonary and intestine absorption. Indacaterol serum concentrations increased with repeated once-daily administration. Steady-state was achieved within 12 to 15 days. The mean accumulation ratio of indacaterol, i.e., AUC over the 24-hour dosing interval on Day 14 or Day 15 compared to Day 1, was in the range of 2.9 to 3.8 for once-daily inhaled doses between 75 mcg and 600 mcg.

Glycopyrrolate: Following repeated once-daily inhalation in patients with COPD, pharmacokinetic steady-state of glycopyrrolate was reached within 1 week of treatment. There was no indication that the glycopyrrolate pharmacokinetics changes over time. With once-daily doses of 124.8 mcg and 249.6 mcg, steady-state exposure to glycopyrrolate (AUC over the dosing interval) was about 1.4- to 1.7-fold higher than after the first dose.

Distribution

Indacaterol: After intravenous infusion the volume of distribution (V_z) of indacaterol was 2,361 to 2,557 L indicating an extensive distribution. The in vitro human serum and plasma protein binding was 94.1 to 95.3% and 95.1 to 96.2%, respectively.

Glycopyrrolate: After intravenous administration, the steady-state volume of distribution (V_{ss}) of glycopyrrolate was 83 L and the volume of distribution in the terminal phase (V_z) was 376 L. The in vitro human plasma protein binding of glycopyrrolate was 38% to 41% at concentrations of 1 to 10 ng/mL.

Metabolism

Indacaterol: In vitro investigations indicated that UGT1A1 is the only UGT isoform that metabolized indacaterol to the phenolic O-glucuronide. The oxidative metabolites were found in incubations with recombinant CYP1A1, CYP2D6, and CYP3A4. CYP3A4 is concluded to be the predominant isoenzyme responsible for hydroxylation of indacaterol. In vitro investigations further indicated that indacaterol is a low affinity substrate for the efflux pump P-gp.

After oral administration of radiolabelled indacaterol in a human ADME (absorption, distribution, metabolism, excretion) study, unchanged indacaterol was the main component in serum, accounting for about one-third of total drug-related AUC over 24 hours. A hydroxylated derivative was the most prominent metabolite in serum. Phenolic O-glucuronides of

indacaterol and hydroxylated indacaterol were further prominent metabolites. A diastereomer of the hydroxylated derivative, a N-glucuronide of indacaterol, and C- and N-dealkylated products were further metabolites identified.

Glycopyrrolate: In vitro metabolism studies show glycopyrrolate hydroxylation resulting in a variety of mono- and bis-hydroxylated metabolites and direct hydrolysis resulting in the formation of a carboxylic acid derivative (M9). Further in vitro investigations showed that multiple CYP isoenzymes contribute to the oxidative biotransformation of glycopyrrolate and the hydrolysis to M9 is likely to be catalyzed by members from the cholinesterase family pre-systemically and/or via first pass metabolism from the swallowed dose fraction of orally inhaled glycopyrrolate. Glucuronide and/or sulfate conjugates of glycopyrrolate were found in urine of humans after repeated inhalation, accounting for about 3% of the dose.

Elimination

Indacaterol: In clinical studies which included urine collection, the amount of indacaterol excreted unchanged via urine was generally lower than 2% of the dose. Renal clearance of indacaterol was, on average, between 0.46 L/h and 1.20 L/h. When compared with the serum clearance of indacaterol of 18.8 L/h to 23.3 L/h, it is evident that renal clearance plays a minor role (about 2% to 6% of systemic clearance) in the elimination of systemically available indacaterol.

In a human ADME study where indacaterol was given orally, the fecal route of excretion was dominant over the urinary route. Indacaterol was excreted into human feces primarily as unchanged parent drug (54% of the dose) and, to a lesser extent, hydroxylated indacaterol metabolites (23% of the dose). Mass balance was complete with $\geq 90\%$ of the dose recovered in the excreta.

Indacaterol serum concentrations declined in a multi-phasic manner with an average terminal half-life ranging from 45.5 to 126 hours. The effective half-life, calculated from the accumulation of indacaterol after repeated dosing ranged from 40 to 56 hours which is consistent with the observed time to steady state of approximately 12 to 15 days.

Glycopyrrolate:

Renal elimination of parent drug accounts for about 60% to 70% of total clearance of systemically available glycopyrrolate whereas non-renal clearance processes account for about 30% to 40%. Biliary clearance contributes to the non-renal clearance, but the majority of non-renal clearance is thought to be due to metabolism.

Following inhalation of single and repeated once-daily doses between 62.4 mcg and 249.6 mcg glycopyrrolate by healthy volunteers and patients with COPD mean renal clearance of glycopyrrolate was in the range of 17.4 L/h and 24.4 L/h. Active tubular secretion contributes to the renal elimination of glycopyrrolate.

Glycopyrrolate plasma concentrations declined in a multi-phasic manner. The mean terminal elimination half-life of glycopyrrolate was much longer after inhalation (33 to 53 hours) than after intravenous (6.2 hours) and oral (2.8 hours) administration.

Drug Interactions

There is no pharmacokinetic drug-drug interaction resulting from the concomitant administration of inhaled glycopyrrolate and inhaled indacaterol based on steady-state exposure data.

No specific drug-drug interaction studies were conducted with UTIBRON NEOHALER. Information on the potential for interactions for UTIBRON NEOHALER is based on the potential for each of its 2 monotherapy components.

Effect of co-administered drugs on indacaterol and glycopyrrolate exposure

Indacaterol:

Inhibitors of Cytochrome P450 3A4 and P-gp Efflux Transporter: Drug interaction studies were carried out using potent and specific inhibitors of CYP3A4 and P-gp (i.e., ketoconazole, erythromycin, verapamil and ritonavir). Coadministration of indacaterol 300 mcg (single dose) with verapamil (80 mg 3 times a day for 4 days) showed 2-fold increase in indacaterol AUC_{0-24h}, and 1.5-fold increase in indacaterol C_{max}. Coadministration of indacaterol inhalation powder 300 mcg (single dose) with erythromycin (400 mg 4 times a day for 7 days) showed a 1.4-fold increase in indacaterol AUC_{0-24h}, and 1.2-fold increase in indacaterol C_{max}. Coadministration of indacaterol inhalation powder 300 mcg (single dose) with ketoconazole (200 mg twice-daily for 7 days) caused a 1.9-fold increase in indacaterol AUC_{0-24h}, and 1.3-fold increase in indacaterol C_{max}. Coadministration of indacaterol 300 mcg (single dose) with ritonavir (300 mg twice-daily for 7.5 days) resulted in a 1.7-fold increase in indacaterol AUC_{0-24h} whereas indacaterol C_{max} was unaffected [see Drug Interactions (7.7)].

Glycopyrrolate:

Cimetidine or Other Inhibitors of Organic Cationic Transport: In a clinical study in healthy volunteers, cimetidine, an inhibitor of organic cation transport which is thought to contribute to the renal excretion of glycopyrrolate, increased total exposure (AUC) to glycopyrrolate by 22% and decreased renal clearance by 23%.

Effect of UTIBRON on co-administered drugs exposure

In vitro studies show that UTIBRON NEOHALER is not likely to inhibit or induce the metabolism of other drugs, nor processes involving drug transporters.

Indacaterol: In vitro investigations indicated that indacaterol has negligible potential to cause metabolic interactions with medications (by inhibition or induction of cytochrome P450 enzymes, or induction of UGT1A1) at the systemic exposure levels achieved in clinical practice. In vitro investigation furthermore indicated that, in vivo, indacaterol is unlikely to significantly inhibit transporter proteins such as P-gp, MRP2, BCRP, the cationic substrate transporters hOCT1 and hOCT2, and the human multidrug and toxin extrusion transporters hMATE1 and hMATE2K, and that indacaterol has negligible potential to induce P-gp or MRP2.

Glycopyrrolate: In vitro inhibition studies demonstrated that glycopyrrolate has no relevant capacity to inhibit CYP1A2, CYP2A6, CYP2C8, CYP2C9, CYP2C19, CYP2D6, CYP2E1 or CYP3A4/5, the efflux transporters MDR1, MRP2 or MXR, and the uptake transporters OATP1B1, OATP1B3, OAT1, OAT3, OCT1 or OCT2. In vitro enzyme induction studies did not indicate a clinically relevant induction by glycopyrrolate for any of the cytochrome P450 isoenzymes tested as well as for UGT1A1 and the transporters MDR1 and MRP2.

Special Populations

Population pharmacokinetic analysis showed no evidence of a clinically significant effect of age (40 to 85 years), body weight (45 to 120 kg), gender, smoking status, and baseline FEV₁ on systemic exposure of either indacaterol or glycopyrrolate following inhalation of UTIBRON NEOHALER.

Similarly no relevant covariate effect (of age body weight, gender, smoking status, and baseline FEV₁) was observed following the inhalation of the 2 components indacaterol and glycopyrrolate separately.

Patients with Renal Impairment

Indacaterol: Due to the very low contribution of the urinary pathway to total body elimination of indacaterol, a study in renally impaired subjects was not performed.

Glycopyrrolate: Renal impairment has an impact on the systemic exposure to glycopyrrolate. A moderate mean increase in total systemic exposure (AUC last) of up to 1.4-fold was seen in subjects with mild and moderate renal impairment [estimated GFR greater than or equal to 30 mL/min/1.73m²] and up to 2.2-fold in subjects with severe renal impairment and end stage renal disease [estimated GFR less than 30 mL/min/1.73m²] [see Use in Specific Populations (8.6)].

Patients with Hepatic Impairment

Based on the clinical pharmacokinetic characteristics of its monotherapy components, UTIBRON NEOHALER can be used at the recommended dose in patients with mild and moderate hepatic impairment. UTIBRON NEOHALER has not been evaluated in subjects with severe hepatic impairment.

Indacaterol: Patients with mild and moderate hepatic impairment showed no relevant changes in C_{max} or AUC of indacaterol, nor did protein binding differ between mild and moderate hepatic impaired subjects and their healthy controls. Studies in subjects with severe hepatic impairment were not performed [see Use in Specific Populations (8.7)].

Glycopyrrolate: Clinical studies in patients with hepatic impairment have not been conducted. Glycopyrrolate is cleared predominantly from the systemic circulation by renal excretion.

Ethnicity

There was no evidence of a clinically significant ethnic/race effect (across Caucasian, Chinese, and Japanese subjects) on the systemic exposure to indacaterol and glycopyrrolate following inhalation of UTIBRON NEOHALER.

Similarly, no relevant ethnic effect was observed following the inhalation of the 2 components indacaterol and glycopyrrolate separately.

12.5 Pharmacogenomics

Indacaterol: The pharmacokinetics of indacaterol were prospectively investigated in subjects with the UGT1A1 (TA)7/(TA)7 genotype (low UGT1A1 expression; also referred to as *28) and the (TA)6, (TA)6 genotype. Steady-state AUC and C_{max} of indacaterol were 1.2-fold higher in the [(TA)7, (TA)7] genotype, suggesting no relevant effect of UGT1A1 genotype of indacaterol exposure.

Glycopyrrolate: The effects of pharmacogenomic variants on the pharmacokinetics of glycopyrrolate have not been investigated.

13 NONCLINICAL TOXICOLOGY

13.1 Carcinogenesis, Mutagenesis, Impairment of Fertility

No studies of carcinogenicity, mutagenicity, or impairment of fertility were conducted with UTIBRON NEOHALER; however, studies are available for the individual components, indacaterol and glycopyrrolate, as described below.

Indacaterol: Indacaterol produced no treatment-related increases in the incidence of tumors in a 2-year inhalation study in Wistar rats at inhaled doses up to 2.09 mg/kg/day (approximately 110 times the MRHD in adults on an AUC basis, respectively). A 26-week oral (gavage) study in CB6F1/TgrasH2 hemizygous mice with indacaterol at doses up to 600 mg/kg/day did not show any evidence of tumorigenicity.

Indacaterol tested negative in the following genotoxicity assays: the *in vitro* Ames test, *in vitro* chromosome aberration test in V79 Chinese hamster cells, and *in vivo* rat bone marrow micronucleus test.

Indacaterol had no effects on fertility and reproductive performance in male and female rats at subcutaneous doses up to 2 mg/kg/day (approximately 890 and 670 times in males and females, respectively, the MRHD in adults on an AUC basis).

Glycopyrrolate: Glycopyrrolate produced no treatment-related increases in the incidence of tumors in a 2-year inhalation study in Wistar rats at inhaled doses up to 0.56 mg/kg/day (approximately 170 times the MRHD in adults on an AUC basis). A 26-week oral (gavage) study in male and female TgrasH2 mice that received glycopyrrolate at doses up to 93.8 and 125.1 mg/kg/day, respectively, did not show any evidence of tumorigenicity.

Glycopyrrolate tested negative in the following genotoxicity assays: the *in vitro* Ames assay, *in vitro* human lymphocyte chromosomal aberration assay, and *in vivo* rat bone marrow micronucleus assay.

Impairment of fertility was observed in male and female rats at a subcutaneous dose of 1.88 mg/kg/day (approximately 1900 and 1100 times the MRHD in adults on an AUC basis, respectively) based upon findings of decreased corpora lutea, implantation sites and live fetuses. No effects on fertility and reproductive performance in male and female rats were observed at a subcutaneous dose of 0.63 mg/kg/day (approximately 350 times the MRHD in adults on an AUC basis).

13.2 Animal Toxicology

Eye findings were seen for glycopyrrolate and were observed in Wistar rats at inhaled doses of 0.67 mg/kg/day and higher (approximately 280 times the MRHD in adults on an AUC basis) based upon findings of anterior capsule opacity, prominent anterior suture line, and anterior cataract. No eye findings in Wistar rats were observed at an inhaled dose of 0.09 mg/kg/day (approximately 60 times the MRHD in adults on an AUC basis). Eye findings were observed in beagle dogs at an inhaled dose of 0.33 mg/kg/day (approximately 150 times the MRHD in adults on an AUC basis) based upon findings of conjunctival hyperemia and corneal opacity. No eye findings in beagle dogs were observed at an inhaled dose of 0.12 mg/kg/day (approximately 100 times the MRHD in adults on an AUC basis).

14 CLINICAL STUDIES

The safety and efficacy of UTIBRON NEOHALER were evaluated in a clinical development program that included 3 dose-ranging trials, 2 lung function trials of 12 weeks duration (placebo-controlled and active-controlled) and a 12-month long-term safety trial. The efficacy of UTIBRON NEOHALER is based primarily on the dose-ranging trials in 562 subjects with COPD or asthma and the 2 placebo- and active-controlled confirmatory trials in 2043 subjects with additional support from one active-controlled 12-month trial in 615 subjects with COPD.

14.1 Dose-Ranging Trials

Dose selection for UTIBRON NEOHALER for COPD was based on data for the individual components, indacaterol and glycopyrrolate.

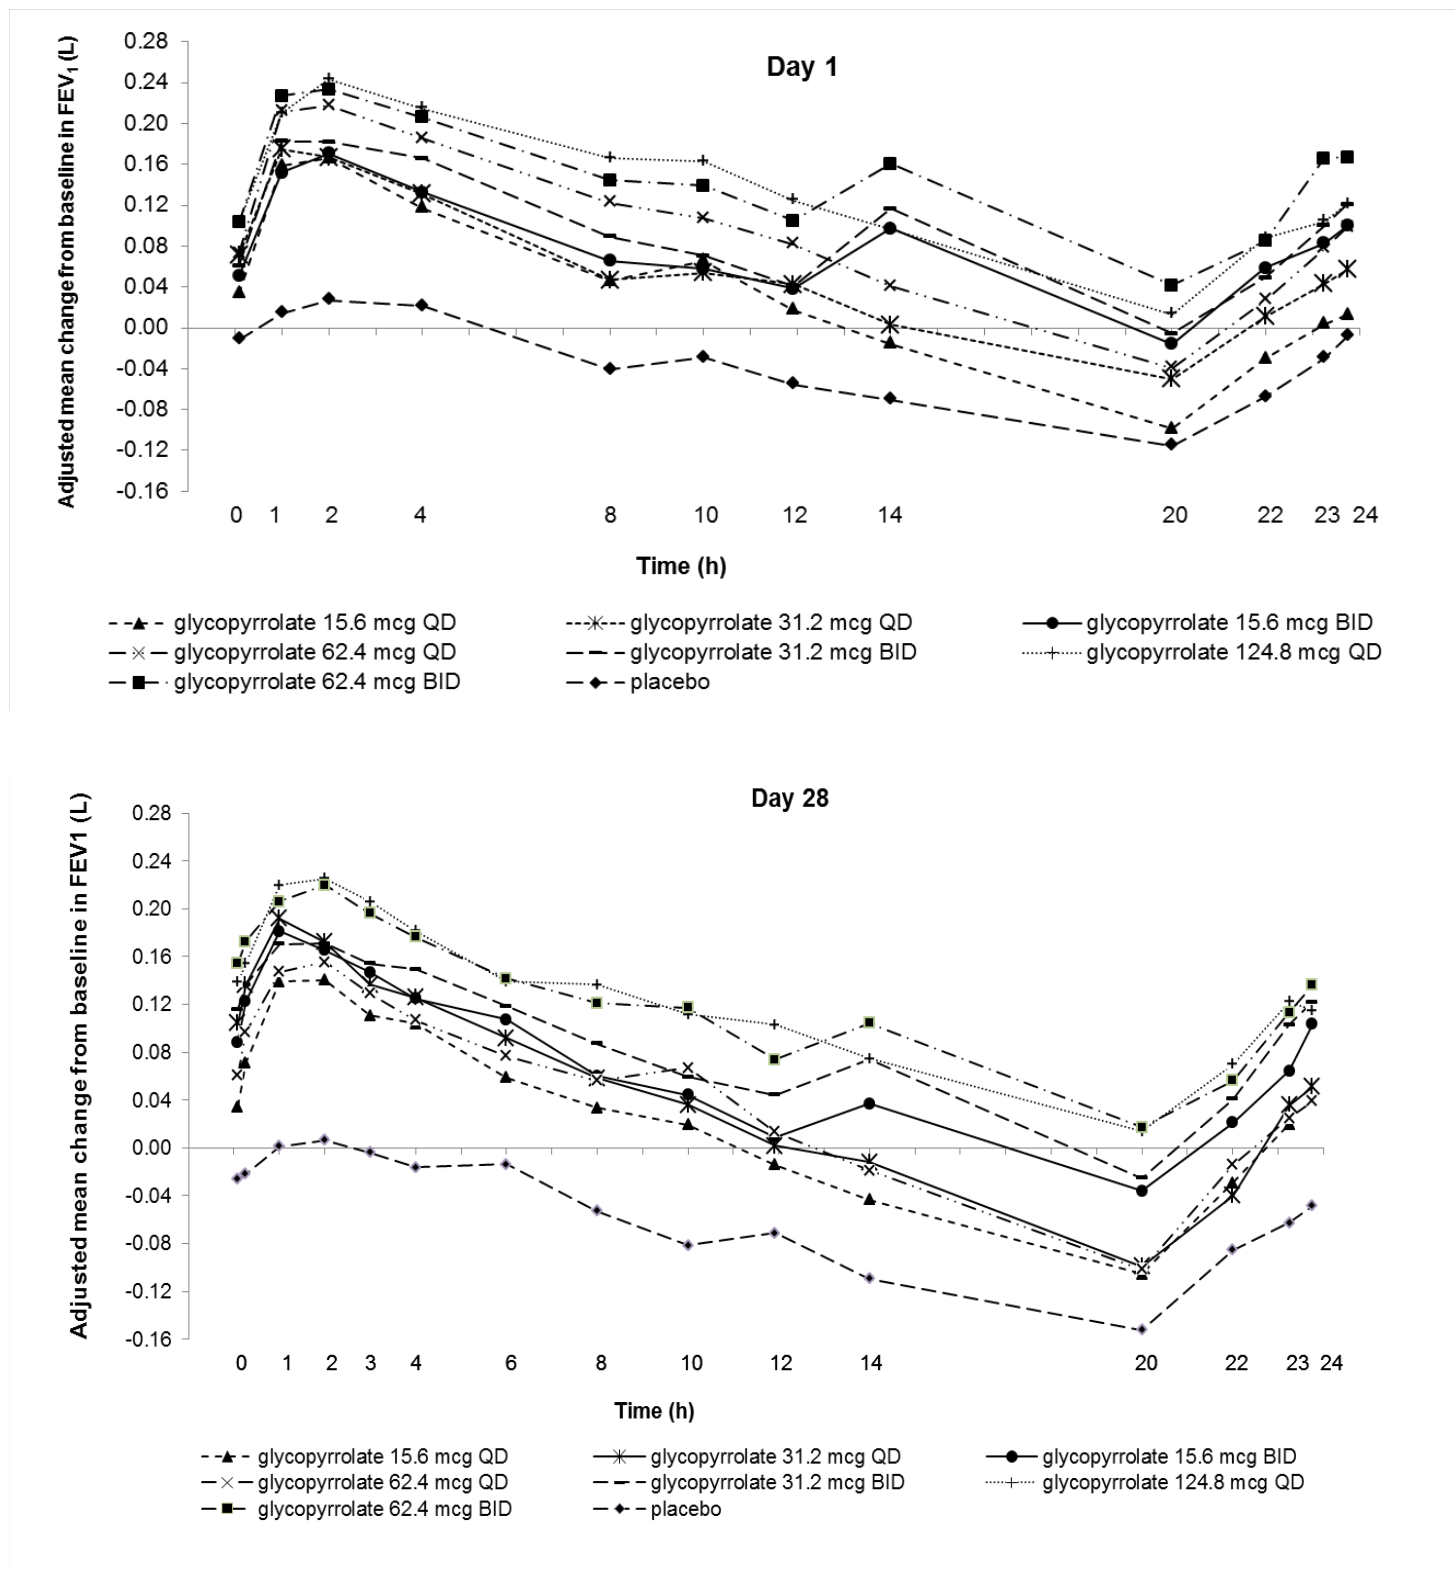

Indacaterol: Indacaterol dose selection in UTIBRON NEOHALER is based on the registered dose of 75 mcg once-daily and is also supported by a single-dose, multicenter, randomized, double-blind, placebo-controlled, crossover study in asthma evaluating 5 doses of indacaterol in 91 subjects, (37.5 mcg, 55 mcg, 75 mcg, and 150 mcg once-daily, and 27.5 mcg twice-daily). A dose-related increase in FEV₁ AUC_{0-24h} compared with placebo was observed. The differences in change from baseline in FEV₁ AUC_{0-24h} after single dosing for the indacaterol 37.5 mcg, 55 mcg, 75 mcg, and 150 mcg once-daily and the 27.5 mcg twice-daily doses compared to placebo were 0.099 L (95% CI: 0.069, 0.128), 0.132 L (0.103, 0.162), 0.143 L (0.114, 0.171), 0.187 L (0.157, 0.216), and 0.121 L (0.092, 0.151), respectively. These results supported the evaluation of indacaterol 27.5 mcg twice-daily in the confirmatory COPD trials. **UTIBRON NEOHALER is not indicated for asthma.**

Figure 1. Adjusted mean change from baseline in FEV₁(L) over 24 hours on Day 1

Glycopyrrolate: Dose selection for glycopyrrolate in UTIBRON NEOHALER in COPD was supported by a 28-day, randomized, double-blind, placebo-controlled, 2-period, crossover study evaluating 7 doses of glycopyrrolate (15.6 mcg, 31.2 mcg, 62.4 mcg, and 124.8 mcg once-daily and 15.6 mcg, 31.2 mcg, and 62.4 mcg twice-daily) or placebo in 388 subjects with COPD. The differences in trough FEV₁ from baseline after 28 days compared to placebo for the 15.6 mcg, 31.2 mcg, 62.4 mcg, and 124.8 mcg once-daily and for 15.6 mcg, 31.2 mcg, and 62.4 mcg twice-daily doses were 0.083 L (95% CI: 0.030, 0.136), 0.098 L (0.048, 0.148), 0.090 L (0.038, 0.142), 0.176 L (0.132, 0.220) 0.139 L (0.089, 0.189), 0.167 L (0.115, 0.219), and 0.177 L (0.132, 0.222), respectively. The dose-ranging results supported the evaluation of glycopyrrolate 15.6 mcg twice-daily in the confirmatory COPD trials.

Figure 2. Adjusted mean change from baseline in FEV₁ (L) over 24 hours on Days 1 and 28

Based on the findings from dose-ranging studies of the individual components, a twice-daily dose of indacaterol/glycopyrrolate 27.5 mcg/15.6 mcg was evaluated in the confirmatory COPD trials.

14.2 Confirmatory Trials

The clinical development program for UTIBRON NEOHALER included two (Trial 1 and Trial 2) 12-week, randomized, double-blinded, placebo- and active-controlled, parallel-group trials in subjects with COPD designed to evaluate the efficacy and safety of UTIBRON NEOHALER; and one 12-month, randomized, double-blind, active-controlled trial (Trial 3) that evaluated bronchodilation and effects on long-term safety.

The 12-week trials evaluated the efficacy of 2038 subjects that had a clinical diagnosis of COPD, were 40 years of age or older, had a history of smoking greater than 10 pack-years, had a post-albuterol FEV₁ greater than or equal to 30% and less than 80% of predicted normal values, had a ratio of FEV₁/FVC of less than 0.7, and were symptomatic as determined by a Modified Medical Research Council (mMRC) score greater than or equal to 2. Of the 2038 subjects included in the efficacy analysis, 63% were male and 91% were Caucasian. They had a mean age of 63 years and an average smoking history of 47 pack-years, with 52% identified as current smokers, and 46% used concomitant inhaled corticosteroids. At screening, the mean post-bronchodilator percent predicted FEV₁ was 55% (range: 29% to 79%), the mean post-bronchodilator FEV₁/FVC ratio was 50% (range: 19% to 71%), and the mean percent reversibility was 23% (range: 0% to 144%).

Trial 1 and Trial 2 evaluated UTIBRON NEOHALER (indacaterol/glycopyrrolate) 27.5 mcg/15.6 mcg twice-daily (BID), indacaterol 27.5 mcg BID, glycopyrrolate 15.6 mcg BID, and placebo BID. The primary endpoint was the change from baseline in FEV₁ AUC_{0-12h} following the morning dose at Day 85 (defined as the mean FEV₁ change from baseline over 0 to 12 hours divided by 12 hours) compared with placebo, glycopyrrolate 15.6 mcg BID, and indacaterol 27.5 mcg BID. The comparison of UTIBRON NEOHALER with indacaterol 27.5 mcg and glycopyrrolate 15.6 mcg was assessed to evaluate the contribution of the individual comparators to UTIBRON NEOHALER. In both trials, UTIBRON NEOHALER demonstrated a larger increase in mean change from baseline in FEV₁ AUC_{0-12h} compared to placebo, indacaterol 27.5 mcg BID, and glycopyrrolate 15.6 mcg BID (see Table 2).

Table 2. Least squares (LS) mean change from baseline in FEV₁ (L) AUC_(0-12h) at Day 85 in Trials 1 and 2 (Intent-to-Treat Population)

Treatment	N	FEV ₁ (L) AUC _{0-12h} at Week 12		
		Difference from		
		Placebo LS Mean (95% CI)	Indacaterol 27.5 mcg BID* LS Mean (95% CI)	Glycopyrrolate 15.6 mcg BID* LS Mean (95% CI)
Trial 1 (N=996)

UTIBRON NEOHALER 27.5 mcg/15.6 mcg BID	258	N=260 0.231 L (0.192, 0.271)	N=260 0.094 L (0.055, 0.133)	N=261 0.098 L (0.059, 0.137)

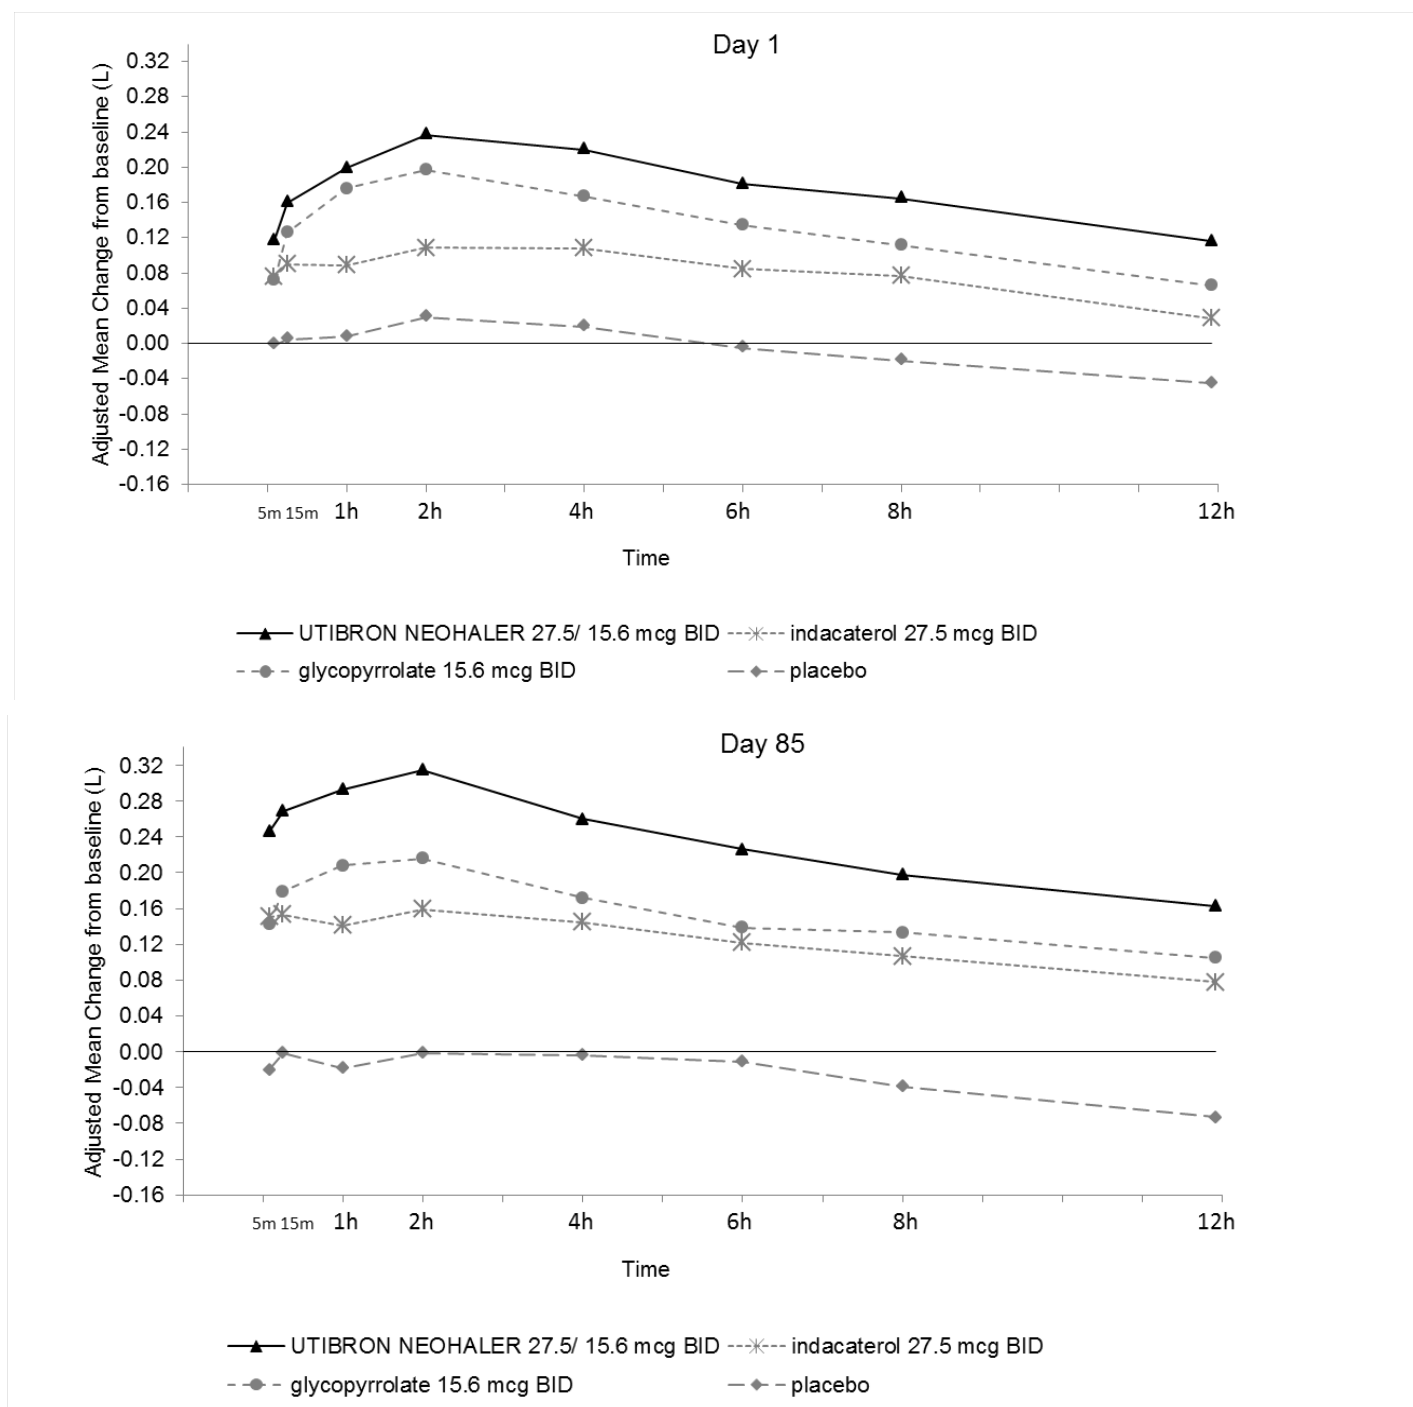

N = Number in intent-to-treat population

* The indacaterol and glycopyrrolate comparators used the same inhaler and excipients as UTIBRON NEOHALER

With the limited data available, there was no suggestion of a difference in FEV₁ AUC_{0-12h} with respect to age, sex, degree of airflow limitation, GOLD stage, smoking status, or inhaled corticosteroid use.

In Trial 1 and Trial 2, serial spirometric evaluations throughout the 12-hour dosing interval were performed in all subjects at Days 1 and 85. The spirometric curves from Trial 1 at Days 1 and 85 are displayed in Figure 3. In Trial 2, the results for UTIBRON NEOHALER in FEV₁ AUC_{0-12h} were similar to those observed in Trial 1.

Figure 3. Adjusted Mean change from baseline in FEV1 (L) over 12 hours on Days 1 and 85 in Trial 1 (All Patient Population)

The peak FEV₁ was defined as the maximum FEV₁ recorded within 4 hours after the morning dose on Days 1 and 85. The mean peak FEV₁ improvement from baseline for UTIBRON NEOHALER compared with placebo at Day 1 and at Day 85 was 0.185L and 0.290L (Trial 1) and 0.151L and 0.260L (Trial 2), respectively. The median time to onset on Day 1, defined as a 100-mL increase from baseline in FEV₁, was 12 minutes and 16 minutes in Trials 1 and 2, respectively, in subjects receiving UTIBRON NEOHALER.

In Trials 1 and 2, patients treated with UTIBRON NEOHALER used less daily rescue albuterol compared to patients treated with placebo.

The St. George's Respiratory Questionnaire (SGRQ) was assessed in Trials 1 and 2. In Trial 2, the SGRQ responder rate

(defined as an improvement in score of 4 or more as threshold) was 57%, 46%, 48%, and 39%, for UTIBRON NEOHALER, glycopyrrolate, indacaterol, and placebo, respectively, with odds ratios of 1.6 (95% CI 1.1, 2.3), 1.5 (95% CI 1.1, 2.2), and 2.2 (95% CI 1.5, 3.2), for UTIBRON NEOHALER vs. glycopyrrolate, UTIBRON NEOHALER vs. indacaterol, and UTIBRON NEOHALER vs. placebo, respectively. In Trial 1, the trends were similar, with odds ratios of 1.4 (95% CI 1.0, 2.0), 1.1 (95% CI 0.8, 1.7), and 2.9 (95% CI 1.9, 4.2), for UTIBRON NEOHALER vs. glycopyrrolate, UTIBRON NEOHALER vs. indacaterol, and UTIBRON NEOHALER vs placebo, respectively.

52-week Effects on Lung Function: At week 52 (Trial 3), UTIBRON NEOHALER demonstrated a significant treatment effect with an increase of 0.080 L in pre-dose trough FEV₁ compared to indacaterol 75 mcg once-daily.

16 HOW SUPPLIED/STORAGE AND HANDLING

How Supplied

UTIBRON NEOHALER contains UTIBRON (indacaterol/glycopyrrolate, (27.5 mcg, 15.6 mcg) inhalation powder) in hypromellose (HPMC) capsule with yellow transparent cap and uncolored transparent body, with capsules packaged in aluminum blister cards, one NEOHALER device, and an FDA approved Medication Guide.

Unit Dose (blister pack), Box of 60 (10 blister cards with 6 yellow transparent capsules each) NDC 0078-0664-19

Unit Dose (blister pack), Box of 6 (1 blister cards with 6 yellow transparent capsules each) NDC 0078-0664-06

The NEOHALER device consists of a white protective cap and a base with mouthpiece, capsule chamber and 2 yellow push buttons.

Storage and Handling

Store in a dry place at 77°F (25°C); excursions permitted to 59°F to 86°F (15°C to 30°C) [see USP Controlled Room Temperature].

- UTIBRON capsules should be used with the NEOHALER device only. Do not use the NEOHALER device with any other capsules.
- Store UTIBRON capsules in the blister protected from light and moisture. Remove the UTIBRON capsules from the blister immediately before use.
- Always use the new NEOHALER inhaler provided with each new prescription.

Keep out of the reach of children.

17 PATIENT COUNSELING INFORMATION

Advise the patient to read the FDA-approved patient labeling (Medication Guide and Instructions for Use).

Asthma-Related Death

Inform patients that LABAs, such as indacaterol, one of the active ingredients in UTIBRON NEOHALER, increase the risk of asthma-related death. UTIBRON NEOHALER is not indicated for the treatment of asthma.

Not for Acute Symptoms

Inform patients that UTIBRON NEOHALER is not meant to relieve acute symptoms of COPD and extra doses should not be used for that purpose. Advise them to treat acute symptoms with a rescue inhaler such as albuterol. Provide patients with such medicine and instruct them in how it should be used [see *Warnings and Precautions* (5.2)].

Instruct patients to seek medical attention immediately if they experience any of the following:

- Symptoms get worse
- Need for more inhalations than usual of their rescue inhaler

Patients should not stop therapy with UTIBRON NEOHALER without physician/healthcare provider guidance since symptoms may recur after discontinuation.

Do Not Use Additional Long-Acting Beta₂-Agonists

Instruct patients to not use other medicines containing a LABA. Patients should not use more than the recommended twice-daily dose of UTIBRON NEOHALER [see *Warnings and Precautions* (5.3)].

Instruct patients who have been taking inhaled, short-acting beta₂-agonists on a regular basis to discontinue the regular use of these products and use them only for the symptomatic relief of acute symptoms.

Paradoxical Bronchospasm

Inform patients that UTIBRON NEOHALER can produce paradoxical bronchospasm. Advise patients that if paradoxical bronchospasm occurs, patients should discontinue UTIBRON NEOHALER.

Risks Associated with Beta₂-Agonist Therapy

Inform patients of adverse effects associated with beta₂-agonists, such as palpitations, chest pain, rapid heart rate, tremor, or nervousness. Instruct patients to consult a physician immediately should any of these signs or symptoms develop [*see Warnings and Precautions (5.6)*].

Worsening of Narrow-Angle Glaucoma

Instruct patients to be alert for signs and symptoms of acute narrow-angle glaucoma (e.g., eye pain or discomfort, blurred vision, visual halos or colored images in association with red eyes from conjunctival congestion and corneal edema). Instruct patients to consult a physician immediately should any of these signs or symptoms develop [*see Warnings and Precautions (5.8)*].

Worsening of Urinary Retention

Instruct patients to be alert for signs and symptoms of urinary retention (e.g., difficulty passing urine, painful urination). Instruct patients to consult a physician immediately should any of these signs or symptoms develop [*see Warnings and Precautions (5.9)*].

Instructions for Administering UTIBRON NEOHALER

It is important for patients to understand how to correctly administer UTIBRON capsules using the NEOHALER device [*see Instructions for Use*]. Instruct patients that UTIBRON capsules should only be administered via the NEOHALER device and the NEOHALER device should not be used for administering other medications. **Remind patients that the contents of UTIBRON capsules are for oral inhalation only and must not be swallowed.**

Instruct patients always to store UTIBRON capsules in sealed blisters and to only remove 1 UTIBRON capsule immediately before use or it may not be as effective. Instruct patients to discard unused additional UTIBRON capsules that are exposed to air (i.e., not intended for immediate use).

Inform patients to use 1 inhalation of UTIBRON NEOHALER orally twice-daily (1 capsule in the morning and 1 capsule in the evening) at the same time every day.

Inform patients that if they miss a dose of UTIBRON NEOHALER, they should use their next capsule at the usual time. Instruct patients to not use 2 capsules at one time and to not use more than 2 capsules in a day

MEDICATION GUIDE
UTIBRON™ NEOHALER®
(yoo-tee-bron)
(indacaterol and glycopyrrolate)
inhalation powder, for oral inhalation use

Important: Do not swallow UTIBRON capsules. UTIBRON capsules are used only with the NEOHALER inhaler that comes with UTIBRON NEOHALER. Do not place a capsule in the mouthpiece of the NEOHALER inhaler.

Read this Patient Information that comes with UTIBRON NEOHALER before you start using it and each time you get a refill. There may be new information. This Patient Information does not take the place of talking to your healthcare provider about your medical condition or treatment.

What is the most important information I should know about UTIBRON NEOHALER?

UTIBRON NEOHALER has been approved for Chronic Obstructive Pulmonary Disease (COPD). UTIBRON NEOHALER is NOT indicated for use in asthma.

UTIBRON NEOHALER may cause serious side effects, including:

- **People with asthma who take long-acting beta₂-adrenergic agonist (LABA) medicines, such as indacaterol (one of the medicines in UTIBRON NEOHALER), have an increased risk of death from asthma problems.**
- **It is not known if LABA medicines, such as indacaterol (one of the medicines in UTIBRON NEOHALER), increase the risk of death in people with COPD.**
- **Call your healthcare provider if breathing problems worsen over time while using UTIBRON NEOHALER. You may need a different treatment.**
- **Get emergency medical care if:**
 - breathing problems worsen quickly
 - you use your rescue inhaler medicine, but it does not relieve your breathing problems

What is UTIBRON NEOHALER?

UTIBRON NEOHALER combines a LABA medicine (indacaterol) and an anticholinergic medicine (glycopyrrolate).

- LABA and anticholinergic medicines help the muscles around the airways in your lungs stay relaxed to prevent symptoms such as wheezing, cough, chest tightness, and shortness of breath. This makes it hard to breathe.
- UTIBRON NEOHALER is used to treat Chronic Obstructive Pulmonary Disease (COPD). COPD is a chronic lung disease that includes chronic bronchitis, emphysema, or both.
- UTIBRON NEOHALER is for long-term use and should be taken, 2 times each day, to improve symptoms of COPD for better breathing.
- **UTIBRON NEOHALER is not used to treat sudden symptoms of COPD.** Always have a short-acting beta₂-agonist medicine (rescue inhaler) with you to treat sudden symptoms of COPD. If you do not have a rescue inhaler, contact your healthcare provider to have one prescribed for you.
- **UTIBRON NEOHALER is not for the treatment of asthma. It is not known if UTIBRON NEOHALER is safe and effective in people with asthma.**
- **UTIBRON NEOHALER should not be used in children.** It is not known if UTIBRON NEOHALER is safe and effective in children younger than 18 years of age.

Who should not use UTIBRON NEOHALER?

Do not use UTIBRON NEOHALER if you:

- are allergic to indacaterol, glycopyrrolate, or any of the ingredients in UTIBRON NEOHALER. Ask your healthcare provider if you are not sure. See **“What are the ingredients in UTIBRON NEOHALER?”** at the end of this Medication Guide for a complete list of ingredients in UTIBRON NEOHALER.

What should I tell my healthcare provider before using UTIBRON NEOHALER?

Before you use UTIBRON NEOHALER, tell your healthcare provider if you:

- have heart problems
- have high blood pressure
- have seizures
- have thyroid problems
- have diabetes
- have liver problems
- have kidney problems
- have eye problems such as glaucoma. UTIBRON NEOHALER may make your glaucoma worse.
- have prostate or bladder problems, or problems passing urine. UTIBRON NEOHALER may make these problems

worse.

- have any other medical conditions.
- are pregnant or plan to become pregnant. It is not known if UTIBRON NEOHALER can harm your unborn baby.
- are breastfeeding or plan to breastfeed. It is not known if the medicines in UTIBRON NEOHALER pass into your breast milk and if it can harm your baby. You and your healthcare provider should decide if you will take UTIBRON NEOHALER or breastfeed.
- are allergic to UTIBRON NEOHALER or any of its ingredients, any other medicines, or food products.

UTIBRON NEOHALER contains lactose (milk sugar) and a small amount of milk proteins. It is possible that allergic reactions may happen in people who have a severe milk protein allergy.

Tell your healthcare provider about all the medicines you take, including prescription medicines, over-the-counter medicines, vitamins, and herbal supplements. UTIBRON NEOHALER may affect the way other medicines work, and other medicines can affect how UTIBRON NEOHALER works. Using UTIBRON NEOHALER with other medicines may cause serious side effects.

Especially tell your healthcare provider if you take:

- Anticholinergics (including umeclidinium, tiotropium, ipratropium, aclidinium, glycopyrrolate).
- LABA medicines (including formoterol, salmeterol, vilanterol, indacaterol, olodaterol)

Know the medicines you take. Keep a list of your medicines with you and show it to your healthcare provider and pharmacist when you get a new medicine.

How should I use UTIBRON NEOHALER?

Read the step-by-step instructions for using UTIBRON NEOHALER at the end of this Medication Guide.

- **Do not** use UTIBRON NEOHALER unless your healthcare provider has taught you how to use the inhaler and you understand how to use it correctly.
- Use UTIBRON NEOHALER exactly as your healthcare provider tells you to use it. **Do not** use UTIBRON NEOHALER more often than prescribed for you.
- **Do not swallow UTIBRON capsules.** Only use UTIBRON capsules with the UTIBRON NEOHALER inhaler.
- **Use 1 UTIBRON capsule inhaled through the NEOHALER inhaler 2 times each day (1 capsule in the morning and 1 capsule in the evening).**
- To make sure that the full dose has been taken, you should open the inhaler to check that there is no powder left in the capsule. As long as the capsule is empty, you have received 1 full dose.
- If you miss a dose of UTIBRON NEOHALER, take it as soon as you remember. Take your next dose at your usual time.
 - Do not use 2 capsules at one time.
 - Do not use more than 2 capsules in a day.
- UTIBRON capsules should always be stored in the blister strip and only removed immediately before use. Peel the backing foil away from the blister to open it, **do not** push the capsule through the foil.
- Always use the new NEOHALER inhaler that is provided with each new prescription.
- **UTIBRON NEOHALER does not relieve sudden symptoms of COPD.** Always have a rescue inhaler medicine with you to treat sudden symptoms. If you do not have a rescue inhaler medicine, call your healthcare provider to have a rescue inhaler prescribed for you.
- **Do not** stop using UTIBRON NEOHALER or other medicines to control or treat your COPD unless told to do so by your healthcare provider because your symptoms might get worse. Your healthcare provider will change your medicines as needed.
- **Call your healthcare provider or get emergency medical care right away** if your breathing problems worsen with UTIBRON NEOHALER, you need to use your rescue medicine more often than usual, or your rescue inhaler medicine does not work as well for you at relieving your symptoms.

What are the possible side effects of UTIBRON NEOHALER?

UTIBRON NEOHALER can cause serious side effects, including:

- **See “What is the most important information I should know about UTIBRON NEOHALER?”**
- **sudden shortness of breath immediately after use of UTIBRON NEOHALER. Sudden shortness of breath may be life-threatening.** If you have sudden breathing problems immediately after inhaling your medicine, stop taking UTIBRON NEOHALER and call your healthcare provider or go to the nearest hospital emergency room right away.
- **serious allergic reactions.** Stop using UTIBRON NEOHALER and call your healthcare provider or get emergency medical care right away if you get any of the following symptoms of a serious allergic reaction:
 - rash
 - swelling of the tongue, lips, and face
 - hives
 - difficulty breathing or swallowing
- **effects on your heart**
 - fast or irregular heartbeat (palpitations)
 - increased blood pressure

- chest pain
- **new or worsened eye problems including acute narrow-angle glaucoma.** Acute narrow-angle glaucoma can cause permanent loss of vision if not treated. Symptoms of acute narrow-angle glaucoma may include:
 - eye pain or discomfort
 - blurred vision
 - red eyes
 - nausea or vomiting
 - seeing halos or bright colors around lights

If you have these symptoms, stop taking UTIBRON NEOHALER and call your healthcare provider right away before taking another dose.
- **new or worsened urinary retention. People who use UTIBRON NEOHALER may develop new or worse** urinary retention. Urinary retention can be caused by a blockage in your bladder. Urinary retention can also happen in men who have a larger than normal prostate. Symptoms of urinary retention may include:
 - difficulty urinating
 - urinating frequently
 - painful urination
 - urination in a weak stream or drips

If you have these symptoms, stop taking UTIBRON NEOHALER and call your healthcare provider right away before using another dose.
- **changes in laboratory blood levels**, including high levels of blood sugar (hyperglycemia) and low levels of potassium (hypokalemia) which may cause symptoms of muscle spasm, muscle weakness or abnormal heart rhythm.

Common side effects of UTIBRON NEOHALER include sore throat and runny nose, high blood pressure, and back pain.

Tell your healthcare provider about any side effect that bothers you or that does not go away.

These are not all of the possible side effects of UTIBRON NEOHALER. For more information, ask your healthcare provider or pharmacist.

Call your doctor or pharmacist for medical advice about side effects. You may report side effects to FDA at 1-800-FDA-1088.

How should I store UTIBRON NEOHALER?

- Store UTIBRON NEOHALER (inhaler and blister-packaged capsules) at room temperature between 68°F to 77°F (20°C to 25°C).
- **Do not** remove UTIBRON capsules from the blister card it comes in until you are ready to use a dose of UTIBRON NEOHALER.
- **Do not** store UTIBRON capsules in the NEOHALER inhaler.
- Keep UTIBRON NEOHALER in a dry place away from light and moisture.

Keep UTIBRON NEOHALER and all medicines out of the reach of children.

General information about the safe and effective use of UTIBRON NEOHALER.

Medicines are sometimes prescribed for purposes other than those listed in a Medication Guide. **Do not** use UTIBRON NEOHALER for a condition for which it was not prescribed. **Do not** give UTIBRON NEOHALER to other people, even if they have the same symptoms you have. It may harm them.

This Medication Guide summarizes the most important information about UTIBRON NEOHALER. If you would like more information, talk with your healthcare provider or pharmacist. You can ask your healthcare provider or pharmacist for information that was written for healthcare professionals.

For more information about UTIBRON NEOHALER or to report side effects, go to www.Utibron.com or call 1-888-669-6682.

What are the ingredients in UTIBRON NEOHALER?

Active ingredient: indacaterol maleate, glycopyrrolate

Inactive ingredients: lactose monohydrate (contains milk proteins) and magnesium stearate.

Instructions for Use
UTIBRON (yoo-TEE-bron) NEOHALER®
(indacaterol and glycopyrrolate)
inhalation powder, for oral inhalation use

For Oral Inhalation Only

Do not swallow UTIBRON capsules.

Follow the instructions below for using UTIBRON NEOHALER. You will breathe-in (inhale) the medicine in the UTIBRON capsules from the NEOHALER inhaler. If you have any questions, **ask your healthcare provider or pharmacist.**

Your UTIBRON NEOHALER

UTIBRON NEOHALER consists of both the inhaler and the blister-packaged capsules. Each package contains UTIBRON capsules and a NEOHALER inhaler.

- (1) NEOHALER inhaler which consists of a cap and a base (see figure below)
- UTIBRON capsules come in blister cards to be used only in the NEOHALER inhaler (see figure below)

Your inhaler is made to give you the medicine contained in the capsules.

Inhaler

Blister card

Inhaler base

Only use the NEOHALER inhaler contained in this pack. Do not use UTIBRON NEOHALER capsules with any other inhaler, **do not** use NEOHALER inhaler to take any other capsule medicine.

How to use your inhaler:

Step 1. Pull off cap.

Step 2. Open inhaler:

Hold the base of the inhaler firmly and tilt the mouthpiece to open the inhaler.

Step 3. Prepare capsule:

Separate 1 of the blisters from the blister card by tearing along the perforation.

Take 1 blister and peel away the protective backing to expose the capsule.

Do not push the capsule through the foil to remove it from the blister.

Step 4. Remove a UTIBRON capsule:

Capsules should always be stored in the blister and only removed immediately before use.

With dry hands, remove 1 capsule from the blister.

Do not swallow the UTIBRON capsule.

Step 5. Insert capsule:

Place the capsule into the capsule chamber.

Do not place a capsule directly into the mouthpiece.

Step 6. Close the inhaler:

Close the inhaler fully. You should hear a 'click' as it fully closes.

Step 7. Pierce the capsule:

Hold the inhaler upright with the mouthpiece pointing up.

Press both piercing buttons together firmly at the same time. You should hear a 'click' as the capsule is being pierced.

Do not press the piercing buttons more than 1 time.

Step 8. Release the piercing buttons fully.

Step 9. Breathe out:

Before placing the mouthpiece in your mouth, breathe out fully.

Do not blow into the mouthpiece.

Step 10. Inhale the medicine:

Before breathing in:

- Hold the inhaler as shown in the figure for Step 10. Make sure that the piercing buttons are to the left and right of the inhaler (not up and down).
- Place the mouthpiece in your mouth and close your lips firmly around the mouthpiece.
- Breathe in rapidly but steadily, as deeply as you can. **Do not press the piercing buttons.**

Step 11. Note:

As you breathe in through the inhaler, the capsule spins around in the chamber and you should hear a whirring noise. You may experience a sweet flavor as you inhale the medicine.

If you do not hear a whirring noise, the capsule may be stuck in the capsule chamber. If this occurs, open the inhaler and carefully loosen the capsule by tapping the base of the inhaler. **Do not press the piercing buttons to loosen the capsule. (Repeat steps 9 and 10 if necessary).**

Step 12. Hold breath:

Continue to hold your breath for at least 5 to 10 seconds or as long as comfortably possible while removing the inhaler from your mouth. Then breathe out.

Open the inhaler to see if any powder is left in the capsule. **If there is powder left in the capsule, close the inhaler and repeat steps 9 to 12.** Most people are able to empty the capsule with 1 or 2 inhalations.

Some people may cough soon after inhaling the medicine. If you do, don't worry, as long as the capsule is empty, you have received 1 full dose.

13

Step 13. Remove capsule:

After you have finished taking your dose of UTIBRON NEOHALER, open the mouthpiece again, remove the empty capsule by tipping it out of the capsule chamber, and throwing it away. Close the inhaler and replace the cap.

Do not leave the used capsules in the NEOHALER inhaler.

Additional Information:

Occasionally, very small pieces of the capsule can get past the screen and enter your mouth. If this happens, you may be able to feel these pieces on your tongue. It is not harmful if these pieces are swallowed or inhaled. **The chances of the capsule shattering will be increased if the capsule is pierced more than once (see Step 7).** Therefore, it is recommended that you follow the storage directions, remove the capsule from the blister immediately before use and pierce each capsule only once.

How to clean your inhaler:

Cleaning the inhaler device is not necessary, however, if you want to clean your inhaler, wipe the mouthpiece inside and outside with a clean, dry, lint-free cloth, or a clean, dry soft brush may be used to wipe the inhaler between uses to remove any powder residue. Keep the inhaler dry.

REMEMBER:

- **Do not swallow UTIBRON capsules.**
- **Only use the NEOHALER inhaler contained in this pack.**
- **Do not** place a UTIBRON capsule directly into the mouthpiece of the NEOHALER inhaler.
- **Do not** blow into the mouthpiece of the NEOHALER inhaler.
- Always release the piercing buttons before inhalation.
- **Do not** press the piercing buttons more than once.
- **Do not** take the NEOHALER inhaler apart.
- Always use the new NEOHALER inhaler that comes with your new UTIBRON NEOHALER medication pack.
- **Do not** use UTIBRON capsules with inhalers from other medicines.

How should I store UTIBRON NEOHALER?

- Store UTIBRON NEOHALER (inhaler and blister-packaged capsules) at room temperature between 68°F to 77°F (20°C to 25°C).
- **Do not** remove UTIBRON capsules from their blister card it comes in until you are ready to use a dose of UTIBRON NEOHALER.
- **Do not** store UTIBRON capsules in the NEOHALER inhaler.
- Keep UTIBRON NEOHALER in a dry place away from light and moisture.

Keep UTIBRON NEOHALER and all medicines out of the reach of children.
